Visualization for Data Science

DS-4630 / CS-5630 / CS-6630

Introduction to Perception

data

knowledge

(analysis—stats, ML, etc.)

(visualization)

(perception)

(cognition)

120 million rods

5-6 million cones

Cone Response

Brain pixels vary enormously in size over the visual field. This reflects differing amounts of neural processing power devoted to different regions of visual space.

At the edge of the visual field we can only barely see something the size of a fist at arm's length.

We can resolve about 100 points on the head of a pin held at arm's length in the very center of the visual field called the fovea.

Over half of our visual processing power is concentrated in a slightly larger area called the parafovea.

Foveation is relatively easy to see. The key to recognizing the phenomenon is to stair at a single **word** on the printed page. Then, without moving your gaze, note the blurriness of the surrounding text.

saccadic eye movements

- rapid involuntary eye movements
- moving: 20-100 ms
- fixations: 200-600 ms

Blind Spot

Close **left** eye

Stare at +

Move forward and backward until ● disappears

Blind Spot

Takeaway

- Our vision at any given moment is relatively limited. Our brain “fills in the missing pieces” using a variety of evolved tools.
- **Be careful placing too much data on the screen. Crisp and clear visualizations will result in the best interpretation.**

edge detection

receptive field

100M rods and cones

1M ganglion cells

low activity
center and surrounds cancel

**activity increased
or decreased at edges**

luminance L

$\frac{dL}{dx}$

Hermann grid effect

consequences of
edge extraction

Cornsweet Illusion

Cornsweet Illusion

Cornsweet Illusion

Cornsweet Illusion

Mach Banding

Takeaway

- Our visual system is attracted to edges and is sensitive to differences, not absolute values.
- **Maximize the contrast with the background if the outlines of shapes are important.**

WEBER'S LAW

- we judge based on relative, not absolute, differences

Unframed

Aligned

AXIS OF ALIGNMENT

AXIS OF ALIGNMENT

simultaneous contrast

simultaneous contrast

Edward H. Adelson

SIMULTANEOUS CONTRAST

SIMULTANEOUS CONTRAST

SIMULTANEOUS CONTRAST

Takeaway

- We have a strong propensity to assume our judgments are absolute, when in fact they are generally relative to the local context.
- **Do your best to not place data in difficult contexts. Choose position and orientation of objects carefully.**

POPOUT

POPOUT

POPOUT

POPOUT

PRE-ATTENTIVE PROCESSING

- requires attention, despite name
- very fast: <200 ms
- what matters most is contrast between features

BASIC POPOUT CHANNELS

Color

lightness

Elementary shape

size

elongation

orientation

Motion

Spatial grouping

Pick the outlier

●
easy

／
difficult

┐
easy

Takeaway

- We can easily see objects that are different in color and shape, or that are in motion.
- **Use color and shape sparingly to make the important information pop out.**

Gestalt principles

- German: “Gestalt” = form
- patterns transcend the visual stimuli that produced them

similarity

similarity

proximity

proximity

connectedness

grouping

Similarity

Connection

Enclosure

grouping

continuity

continuity

closure

figure / ground

M.C. Escher: *Sky and Water I* 1938 woodcut

common fate

Gestalt principles

- **similarity**: things that look like each other (size, color, shape) are related
- **proximity**: things that are visually close to each other are related
- **connection**: things that are visually connected are related
- **continuity**: we complete hidden objects into simple, familiar shapes
- **closure**: we see incomplete shapes as complete
- **figure / ground**: elements are perceived as either figures or background
- **common fate**: elements with the same moving direction are perceived as a unit

Takeaways

- Gestalt principles give us a conceptual understanding of the way our mind converts shapes into structured thought.
- **Using the Gestalt principles wisely will lead improve performance in interpretation of visualizations. Poor use may cause users to see things that aren't there...**
